

PACE Town Hall

2016 Ocean Sciences Meeting

22 Feb 2016

What is PACE?

PACE provides a strategic climate continuity mission that will collect many global measurements essential for understanding marine and terrestrial biology, biogeochemistry, ecology, and cloud and aerosol dynamics.

Pre-Aerosols, Clouds, and ocean Ecosystems

Plankton

global continuous spectroradiometric measurements from the UV to SWIR to enable ocean color & cloud/aerosol studies & continuity of their multi-decadal data records ... plus, multi-angular photopolarimetry to support advanced cloud/aerosol/ocean color research.

Responding to the Challenge of Climate and Environmental Change:

NASA's Plan for a Climate-Centric Architecture for Earth Observations and Applications from Space

June 2010

Climate Continuity Missions: The FY2011 budget request allows NASA to address important scientific needs for continuity of key climate observations.

- Refurbishment of the SAGE-III instrument and of a hexapod pointing platform, and accommodation studies for a flight opportunity on the ISS as early as 5/2014, if transportation to the ISS can be arranged;
- Development of a GRACE Follow-on mission (with a launch in 2016) as a gap-filler between the operating GRACE and the recommended higher-capability GRACE-II Decadal Survey Tier 3 mission.
- Development of an ocean color and clouds/aerosols polarimetry mission (launch in 2018) to bridge between existing on-orbit missions and the future, more capable ACE Tier 2 mission.

Overarching science questions

PACE is focused on global ecosystem structure, physics, health, & carbon dynamics to resolve reasons & consequences of change in today's oceans & atmospheres to predict and prepare for tomorrow's Earth

WHY are ecosystems changing?

FACT: atmospheric CO₂ concentrations are rising.

QUESTION: how are Earth's oceans & atmospheres responding?

WHICH species are involved?

**WHAT are the
consequences & HOW
will the future Earth look?**

PACE advanced science questions

What are the standing stocks & compositions of ocean ecosystems? How & why are they changing?

How & why are ocean biogeochemical cycles changing? How do they influence the Earth system?

How do physical ocean processes affect ocean ecosystems? How do ocean biological processes influence ocean physics?

What is the distribution of both harmful & beneficial algal blooms & how is their appearance & demise related to environmental forcing?

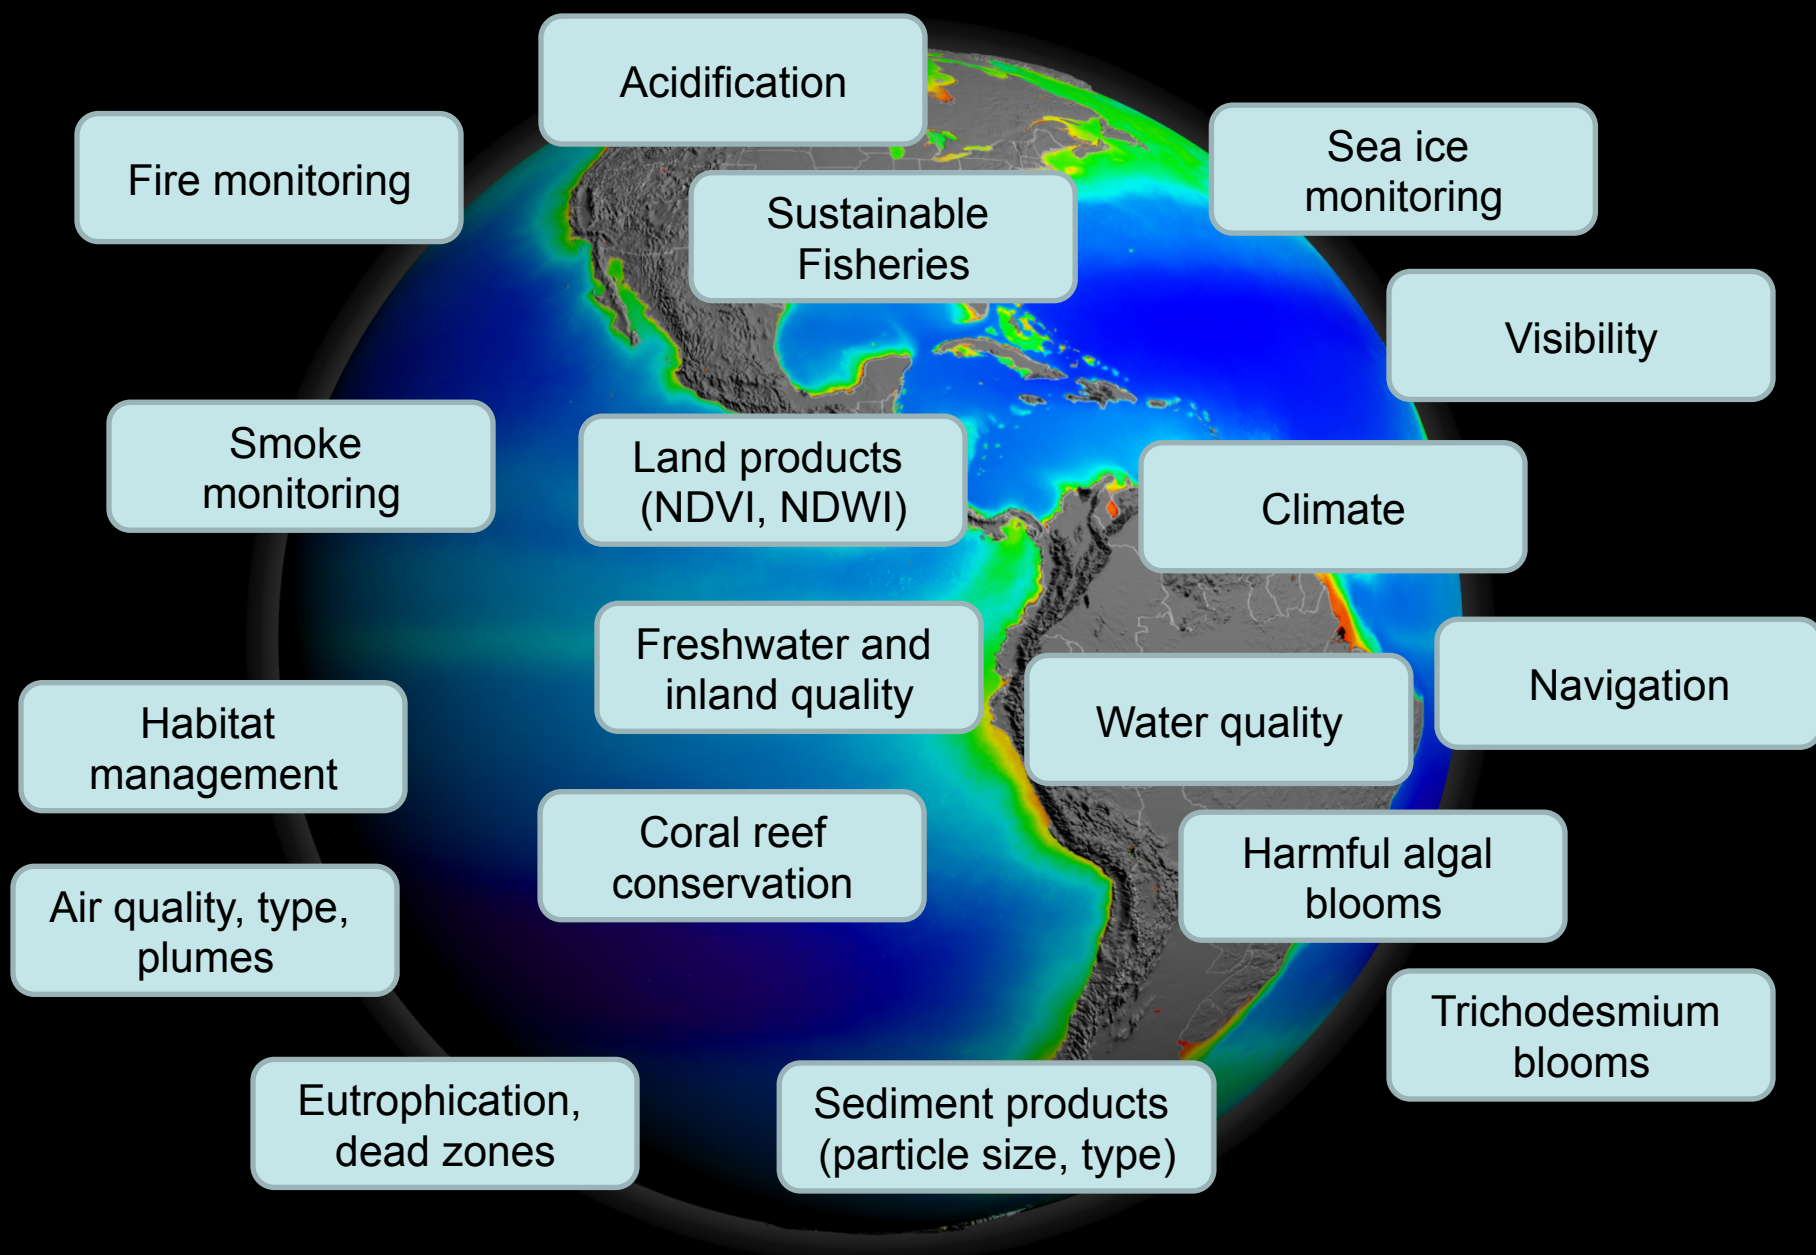

How do changes in critical ocean ecosystem services affect human health & welfare? What science-based management strategies need to be implemented to sustain our health & well being?

What are the long-term changes in aerosol & cloud properties & how are these properties correlated with inter-annual climate oscillations?

What are the magnitudes & trends of direct radiative forcing & its anthropogenic component?

How do aerosols influence ocean ecosystems & biogeochemical cycles?
How do ocean biological & photochemical processes affect the atmosphere?

Please see also the 2012 PACE Science Definition Team Report

**Applied Sciences: novel applications of PACE data
will allow to address some of our most pressing environmental issues**

Fire monitoring

Fisheries

Sea ice

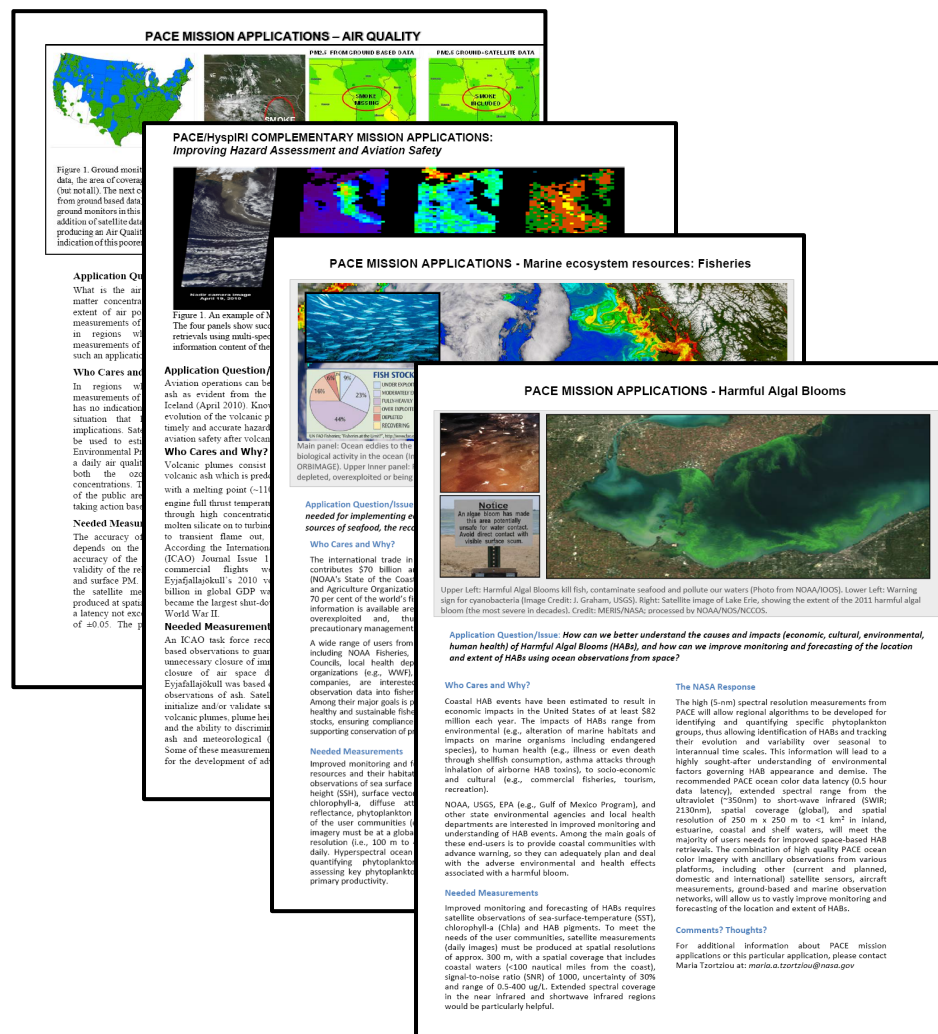

Eutrophication

Acidification

Harmful algal blooms

Climate

PACE Applications White Papers

PACE Applications Traceability Matrix

developed with input from the user community

PACE Application Questions & Concepts

What is the air quality forecast of particulate matter (PM) predicted from PACE measurements of the aerosol optical depth (AOD) in regions where there are no direct measurements of PM?

The EPA produces a daily air quality index which comprises both the ozone and PM concentrations. In regions where there are no direct measurements of particulate matter, satellite measurements of AOD can be used to estimate PM.

Application Readiness Level: 3
Applied Sciences Category: Public Health and Air Quality
Potential Host Agency: EPA (James Szykman)

Mission Data Product: Aerosol Optical Depth	Projected Mission Performance: AOD within +/- 0.02 at a horizontal resolution of 250 m
Spatial resolution: <1 km	Auxiliary Measurements: Aerosol vertical distributions, Surface PM concentrations (at a few locations)
Latencies: <1 hour	

What is the volcanic ash concentration during and after a volcanic eruption? Is there an impact on air quality as a result of a volcanic material deposited in coastal/populated regions?

Measurements collected to support PACE atmospheric corrections in coastal regions may be used to quantify the concentration of material associated with volcanic eruptions. These data may be useful in enabling prudent ash-related aviation hazard mitigation policies and advisories.

Application Readiness Level: 3
Applied Sciences Category: Disaster Mitigation, Public Health and Air Quality
Potential Host Agency: FAA, EPA, NOAA, International Civil Aviation Organization, Volcanic Ash Advisory Centers (Shobha Kondragunta, NOAA)

Mission Data Product: Aerosol Optical Depth	Projected Mission Performance: AOD within +/- 0.02 at a horizontal resolution of 250 m
Spatial resolution: <1 km	Auxiliary Measurements: Aerosol vertical distributions, Sulfur dioxide concentrations
Latencies: <1 hour	

How do exchanges across the land-ocean interface influence carbon and nutrient loadings, water quality, and ecosystem dynamics in coastal waters?

The EPA Safe and Sustainable Water Resources Research Program aims at developing core indicators of water resource integrity and sustainability as well as indicators of key drivers and pressures across a range of spatial and temporal scales for use in integrated assessments. Integration of satellite observations with field measurements and modeling tools is needed to demonstrate assessment of sustainability and integrity of water resources.

Application Readiness Level: 3
Applied Sciences Category: Water Resources, Oceans, Coasts, Great Lakes, Ecosystems and Human Health
Potential Host Agency: EPA (Blake Schoeffel)

Mission Data Products: Chl-a, K _d (water quality)	Projected Mission Performance: 0.5 hour data latency, direct broadcast of 5 nanometer resolution data, spatial resolution of 1 km (+/-10%) at all angles across track. Along track spatial resolution of 250 m to <1 km for inland, estuarine, coastal and shelf area retrievals for all bands or a subset of bands.
Spatial resolution: Estuaries: <250 m Coastal Waters: <500 m	Auxiliary Measurements: Aerosols (spectral shape, vertical distribution), NO ₂ , O ₃ concentrations for atmospheric correction
Coverage: Minimum distance: 5.5 km Maximum distance: 22 km	
Latencies: 0.5-12 hours	

How are the productivity and biodiversity of coastal ecosystems changing, and how do these changes relate to natural and anthropogenic forcing, including local to regional impacts of climate variability?

PACE satellite-derived optics and biogeochemical variables may be assimilated into operational seasonal-to-interannual computer models. As a result, PACE data may improve model skills and forecasting capabilities of the Global Ocean Data Assimilation System / Coupled Forecast System (GODAS/CFS) and Real-Time Ocean Forecast System (RTOPS).

Application Readiness Level: 3
Applied Sciences Category: Ecological Forecasting
Potential Host Agency: NOAA (Paul DiGiacomo, Cara Wilson)

Mission Data Products: Chl-a, K _d , K _{sat}	Projected Mission Performance: 0.5 hour data latency, direct broadcast of 5 nanometer resolution data, spatial resolution of 1 km (+/-10%) at all angles across track. Along track spatial resolution of 250 m to <1 km for inland, estuarine, coastal and shelf area retrievals for all bands or a subset of bands.
Spatial resolution: 1 km	Auxiliary Measurements: Aerosols (spectral shape, vertical distribution), NO ₂ , O ₃ concentrations for atmospheric correction
Temporal resolution: Daily	
Coverage: Global	
Latencies: 12 hours	

How can PACE help with oil spill monitoring and response?

NOAA's subsurface oil monitoring program uses various modeling and observational approaches (airborne, shipborne, ground-based, space-based measurements) to track oil spills: where the oil is going on the surface and under the sea, and what the consequences are to local communities, wildlife and the marine environment (e.g., Deepwater Horizon/BP Oil Spill).

Application Readiness Level: 3
Applied Sciences Category: Disasters, Water Resources
Potential Host Agency: NOAA (Paul DiGiacomo, Cara Wilson)

Mission Data Product: Visible/true color imagery	Projected Mission Performance: 0.5 hour data latency, direct broadcast of 5 nanometer resolution data, spatial resolution of 1 km (+/-10%) at all angles across track. Along track spatial resolution of 250 m to <1 km for inland, estuarine, coastal and shelf area retrievals for all bands or a subset of bands.
Spatial resolution: <300 m	Auxiliary Measurements: Aerosols (spectral shape, vertical distribution), NO ₂ , O ₃ concentrations for atmospheric correction
Temporal resolution: 1 hr	
Coverage: Coastal waters: <185 km 50N - 10N 106W - 60W	
Latencies: 0.5-1 hours	

ARL 3: Proof of Application Concept (Viability Established) - Feasibility studies to assess the potential viability of and provide a proof-of-concept for the application have been conducted.

The PACE mission

HQ/ESD letter of direction in Dec 2014

- Mission management directed to NASA GSFC
- Ocean color instrument (OCI) to be built at GSFC
- Polarimeter is a second (optional) instrument
 - contributed or procured
 - directed to JPL
- Science data processing directed to GSFC Ocean Biology Processing Group

Mission characteristics

- \$805M “design-to-cost” cost-capped mission
 - project team, spacecraft, launch vehicle, instruments, 3 years of mission ops, calibration/validation, science data processing, mission science
 - 65% cost confidence
- Class C (short duration, minimum risk)
- 3 year mission; 10 years of fuel
- Sun synchronous polar orbit
- 98° inclination at ~675 km altitude

The PACE Ocean Color Instrument (OCI)

	Mission Threshold Req.	SDT Threshold	SDT Goal
Earth surface spatial resolution	1 km ² at nadir	1 km ² at nadir	<i>1 km² to edge of scan; 250 – 500 m² at nadir</i>
Orbit	Sun synchronous, polar orbit w/ equatorial crossing time near local noon	Sun synchronous, polar orbit w/ equatorial crossing b/w 11:00 & 13:00	Sun synchronous, polar orbit w/ equatorial crossing @ noon
Global coverage	2-day to solar zenith ≤ 75° & sensor zenith ≤ 60°	2-day to solar zenith ≤ 75° & sensor zenith ≤ 60°	1-day with solar zenith > 75°
Instrument tilt	Yes	Yes	Same as threshold
Lunar calibration	Through Earth view port w/ illumination of all detectors	Through Earth view port w/ illumination of all detectors	Same as threshold
Image artifacts	Striping artifacts ≤ 0.5% and correctable to noise levels	Total artifact contribution to TOA < 0.5% & <i>striping ≤ 0.1%</i> of calibrated TOA	Total artifact contribution to <i>TOA < 0.2%</i>
Accuracy / precision	20% or 0.004 for 350-395 nm 5% or 0.001 for 400-600 nm 10% or 0.002 for 700-900 nm	5% or 0.001 for 400-710 nm	<i>10% or 0.002</i> for 350-395 nm
Mission duration	3 years w/ 10 years of fuel	<i>5 years</i>	<i>10 years</i>
UV-VIS-NIR	350-800 nm @ 5 nm	350-800 nm @ 5 nm	350- <i>900</i> nm @ 5 nm
SWIR	940, 1380, 2130, 2250 nm	940, 1380, 2130, 2250 nm + <i>1240, 1640 nm</i>	Same as threshold

colors show differences b/w SDT report & HQ requirements: *can meet or exceed*; *unknown*; *may/will not meet*

PACE standard data products

Discipline	Data Product
ocean color	water-leaving reflectance: 350-395 nm
	water-leaving reflectance: 400-600 nm
	water-leaving reflectance: 600-800 nm
	concentration of chlorophyll-a
	diffuse attenuation coefficient: 490 nm
	concentration of particulate inorganic carbon
	concentration of particulate organic carbon
	photosynthetically available radiation
	total absorption: 350-700 nm
	phytoplankton absorption: 350-700 nm
	non-algal + CDOM absorption: 350-700 nm
	particulate backscattering: 350-700 nm

Required data product

Additional data products

Discipline	Data Product
aerosols	aerosol optical depth: UV
	aerosol optical depth: VIS over land
	aerosol optical depth: VIS over ocean
	aerosol optical depth: fine model aerosol fraction over dark water
clouds	cloud layer detection
	cloud top pressure: low clouds when optically thick or over dark surfaces
	cloud top pressure: high clouds
	cloud water path: liquid clouds
	cloud water path: ice clouds
	cloud optical thickness: liquid clouds with small sub-pixel heterogeneity
	cloud optical thickness: ice clouds
polarimetric	single scattering albedo
	aerosol layer height
	effective radius
	real refractive index
	imaginary refractive index
	radiometry

PACE standard data products

PACE target (ocean) data products

A PACE polarimeter?

Rationale for prioritization	Priority	Minimum Capability	Enhanced Capability
PACE is a climate-science mission. Global polarimetry will: (1) Reduce uncertainties in aerosol characterizations for input into global climate forcing (e.g., IPCC) models; and (2) Improve ocean color atmospheric correction, thus improving understanding of global ocean ecosystems and carbon cycles	1a	% ground coverage of OCI Swath Not specified <i>Target: 50%</i>	% ground coverage of OCI Swath Not specified <i>Target 90%</i>
	1b	Swath width $\pm 15\text{-}25^\circ$	Swath width $\pm 30^\circ$
The utility of the measurements degrades when uncertainties exceed 1%	2	DOLP uncertainty <0.01	DOLP uncertainty <0.005
Spectral resolution, number of polarized bands, and angular range (# of scattering angles) all dictate what derived products can be produced	3a	Spectral channels >4 over 400-1600 nm + 2200 nm only if sparse angular sampling	Spectral channels Minimum + 940 nm or O2 A-band and 1378 or 1880 nm
	3b	Angular range $\pm 50^\circ$ at satellite in all bands	Angular range $\pm 55^\circ$ at satellite in all bands
Multiangular capabilities enhance the ability to estimate many cloud and aerosol properties	4a	Number of angles 5-6 for clouds	Number of angles ~50 for cloud bows
	4b	Number of angles 4 for aerosols	Number of angles 10 for aerosols
4 km is adequate for climate science		Pixel size / Spatial resolution 5 km	Pixel size / Spatial resolution 1 km
All concepts meet the radiometric and SNR requirements		Radiometric uncertainty 5%	Radiometric uncertainty 3%
		SNR Not specified	SNR Not specified

Enhanced capabilities identified based on recent work in the peer reviewed literature.

The minimum capability follows those for 3MI, which was featured in the PACE SDT.

A PACE polarimeter?

Rationale for prioritization

	Priority	Minimum Capability	Enhanced Capability
PACE is a climate-science mission. Global polarimetry will: (1) Reduce uncertainties in aerosol characterizations for input into global climate forcing (e.g., IPCC) models; and (2) Improve ocean color atmospheric correction, thus improving understanding of global ocean ecosystems and carbon cycles	1a	% ground coverage of OCI Swath Not specified <i>Target: 50%</i>	% ground coverage of OCI Swath Not specified <i>Target 90%</i>

Enhanced capabilities identified based on recent work in the peer reviewed literature.

The minimum capability follows those for 3MI, which was featured in the PACE SDT.

Other capabilities for the PACE payload: not required, but under study

A high spatial resolution (~100 m) spectroradiometer to study coastal/inland ecosystems & cloud microphysics

- Request for Information to industry released in Jul 2015
- 9 responses from industry, 3 from academia/government

Support for NASA Earth Venture class instruments

- <http://science.nasa.gov/about-us/smd-programs/earth-system-science-pathfinder/>

Direct broadcast communications capabilities

- <http://directreadout.sci.gsfc.nasa.gov/>

The first PACE Science Team

Competed in 2014, awarded for a 3 year period (**2015-2017**)
24 members, incl. 2 institutional GSFC & 2 Applied Sciences

Science Team leaders:

Emmanuel Boss (UMaine) & Lorraine Remer (UMBC)

Focus:

Theoretical and analytical studies focused on inherent optical properties (IOPs) & atmospheric correction (including aerosol and cloud retrievals) with a remote sensing focus on hyperspectral radiometry and polarimetry

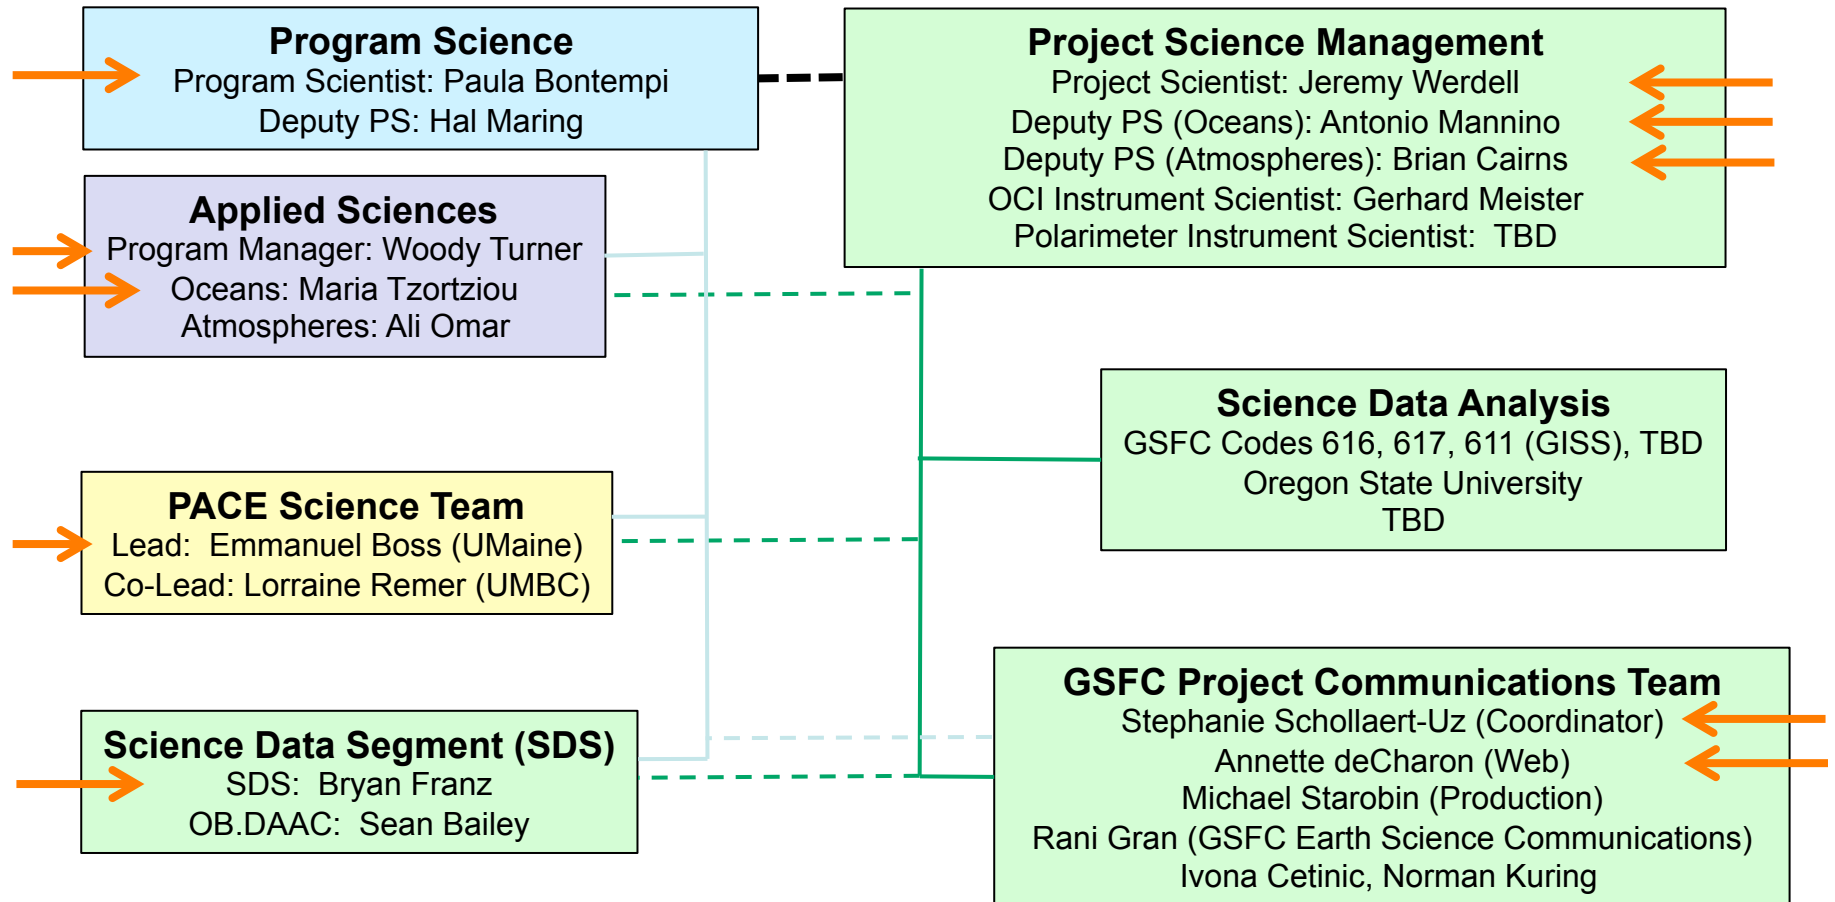

Deliverable:

Provide a consensus report outlining the path forward for producing operational algorithms for atmospheric correction and inherent optical properties (IOPs)

Goal:

Develop community-endorsed paths forward for PACE

Defining Priorities for NASA in Ocean Ecology and Biogeochemistry: 2017–2027

TOWN HALL

Synopsis

The next Decadal Survey for Earth Science, due out in 2017, will establish the observational needs and priorities for NASA, USGS and NOAA and will help guide the development of future space-based missions. NASA's Ocean Biology and Biogeochemistry Program is facilitating the development of a pre-Decadal Survey report that will identify the most pressing science questions and gaps in our understanding of ocean carbon-climate-ecosystem processes and prioritize new technology, modeling, and instrument/mission needs for the next decade. This townhall will engage the ocean community in reviewing and commenting on the OBB pre-Decadal Survey report.

PACE Pre-Aerosols Clouds and ocean Ecosystems

HOME FEATURES TEAM SOCIAL 

NASA Sets the PACE for Advanced Studies of Earth's Changing Climate

The Pre-Aerosols Clouds and ocean Ecosystems (PACE) mission will deliver the most comprehensive look at global [ocean color](#) measurements in NASA's history. Not only will PACE monitor the health of our ocean, it will also expand atmospheric studies by sensing our skies over an exceptionally broad spectrum of wavelengths.

PACE will monitor key climate-relevant factors: aerosol particles, clouds, and many factors related to the marine carbon cycle, including the phytoplankton pigment, chlorophyll. Together these data will provide science and society with unprecedented insights into how water, carbon, and other particles cycle through Earth's system.

In addition, novel applications of PACE data will help with many of our most pressing environmental issues. From short-term forecasting of harmful algal blooms and air quality to improving long-term climate models, PACE will be an essential tool for understanding our warming planet.

PACE provides a strategic climate continuity mission that will collect global measurements essential for understanding marine and terrestrial biology, biogeochemistry, ecology, cloud and aerosol dynamics in support of NASA's [Plan for a Climate-Centric Architecture for Earth Observations and Applications from Space \(2010\)](#).

Why Do We Need PACE?

Ocean Color Carbon Aerosols & Clouds Science Questions

Movement in the ocean is a complex interplay of currents and eddies. High above earth's surface, satellite sensors specifically tuned to see colors of the ocean reveal the presence of life: swirls and streaks as beautiful as masterpiece paintings. Beyond their beauty, these images provide valuable information about biological and chemical processes in our ocean.

Marine ecosystems depend on the health and productivity of single-celled organisms called phytoplankton. These algae either swim weakly or not at all. They spend their lives suspended in seawater, at the mercy of the ocean's motion. With dissolved carbon dioxide readily available, phytoplankton need only two additional things to survive: sunlight and nutrients.
